RAPID RESCUE

About Us

We provide Highly skilled responders, including paramedics, firefighters, and rescue technicians, ready to act quickly. Equipped with fast vehicles and advanced technology to ensure timely arrival at the scene. Immediate medical care on-site, stabilizing patients before transport to medical facilities.

RAPID RESCUE

Problem Definition

The current rapid rescue system faces significant challenges, including delayed response times, insufficient coordination among rescue teams, inadequate resource management, and lack of public awareness about available services. These issues compromise the overall effectiveness of rescue efforts, potentially leading to increased casualties and lower survival rates.

RAPID RESCUE

Design Specifications

The Rapid Rescue Web application will be a responsive and user-friendly platform for individuals and emergency services. Users can request ambulances, track their location, provide medical information, and receive basic first-aid instructions. Dispatchers can manage and assign ambulances, while EMTs can access patient information and update their status. The application will not handle billing or insurance claims, as these are beyond the scope of this system.
